PURPOSE: To obtain the subject end carboxyl-containing compound having improved degree of pigmentation in subjecting lactone monomer to ring-opening polymerization in the presence of an unsaturated monomer by using tungstic acid as a catalyst. **CONSTITUTION:** A carboxyl-containing unsaturated monomer (e.g. acrylic acid, or beta-acryloyloxyethylsuccinic acid) is reacted with a lactone monomer (e.g. epsilon-caprolactone) or a caprolactone polymer having 10,000-100,000 molecular weight in the presence of 0.01-10% (preferably 0.1-5%) tungstic acid preferably at 60-120 deg.C to give the objective compound.
